

AIAA CFD Drag Prediction Workshop

Presenter: **Dr. Uriel Goldberg**

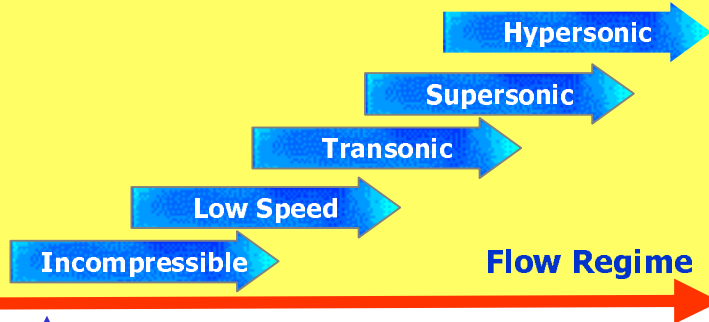

Metacomp Technologies, Inc.

Anaheim, CA June 9-10, 2001

Attributes of CFD++

Seamlessly handles most flow regimes

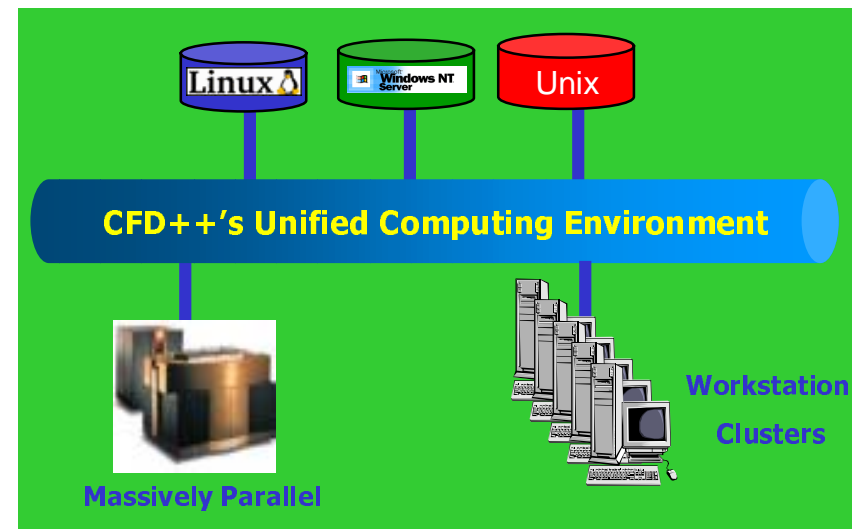

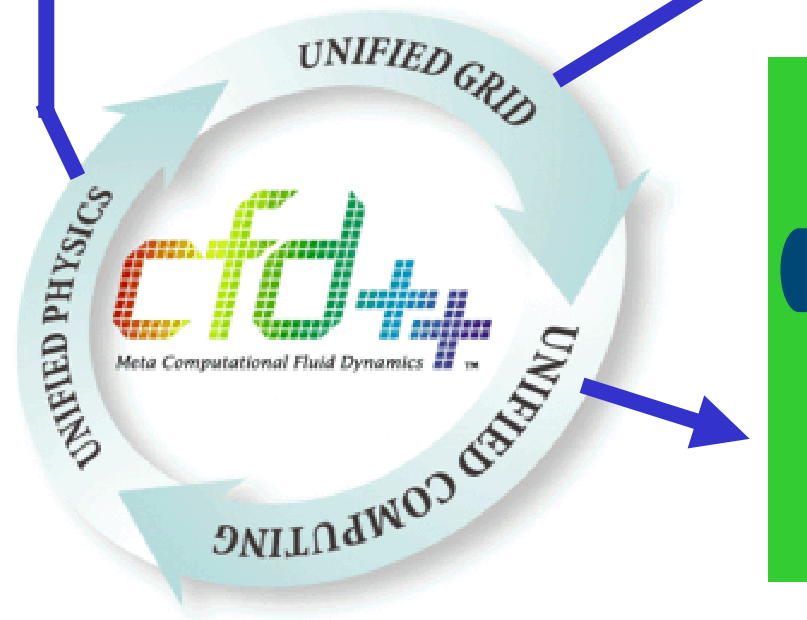

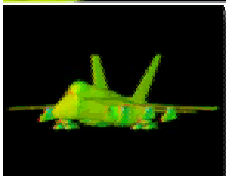

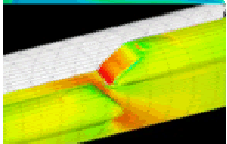

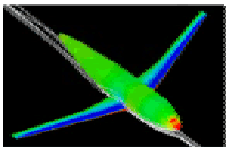

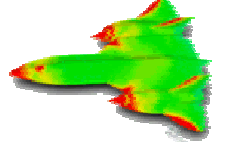

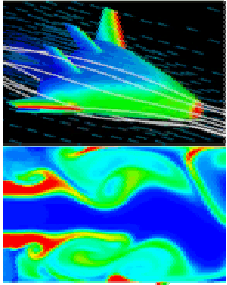

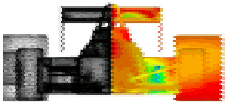

- Ability to handle all Cell types; e.g.:

- Ability to handle all grids

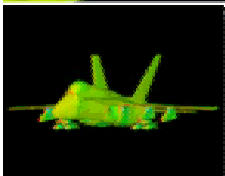

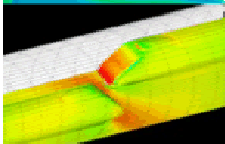

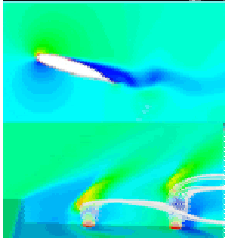

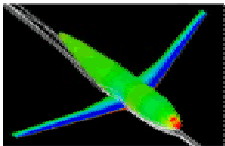

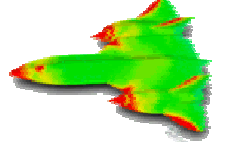

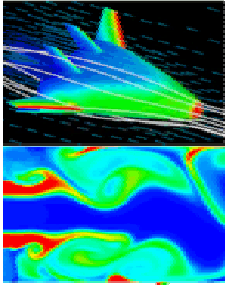

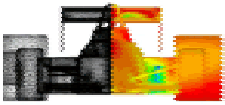

- ♦ Structured
- ♦ Unstructured
- ♦ Hybrid
- ♦ Patched non-aligned
- ♦ Overset
- ♦ Meshes with gaps

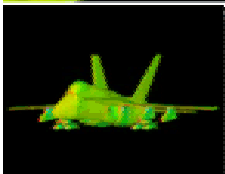

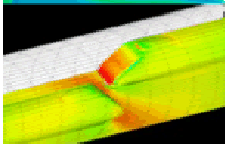

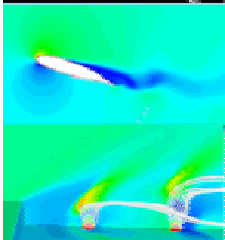

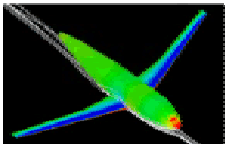

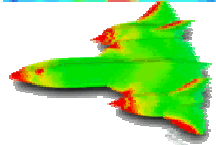

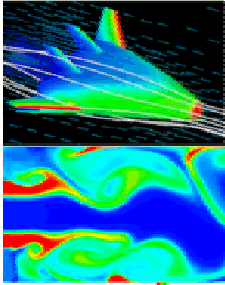

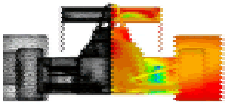

Numerical Framework in CFD++

- Finite Volume Framework
- Spatial discretization
 - Multi-dimensional TVD scheme for inviscid terms
 - Non-decoupling non-limited face polynomials for viscous terms.
- Time Integration
 - Explicit Runge-Kutta schemes
 - Point Implicit with Multigrid relaxation
- Riemann Solvers

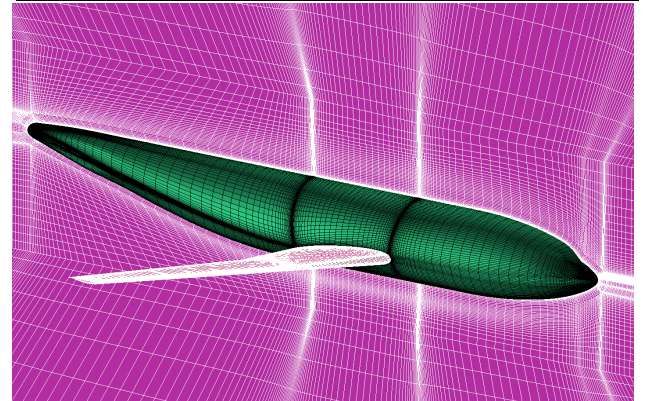

Physical Models

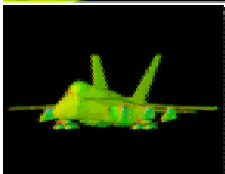

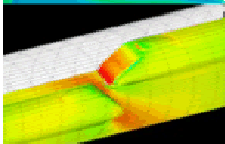

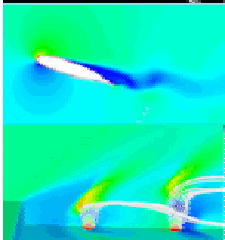

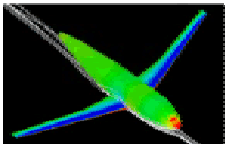

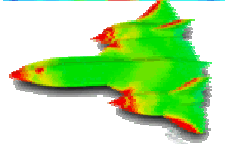

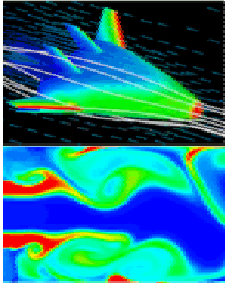

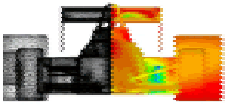

- Turbulence Models
 - 1,2, & 3 Eq. closures
 - Linear, Cubic
 - Advanced Wall Function
- LES and hybrid RANS/LES models
- Reacting flows
- Multi-phase

Computational Grid

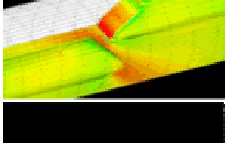

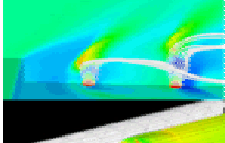

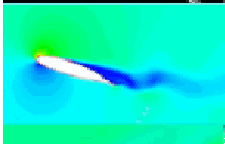

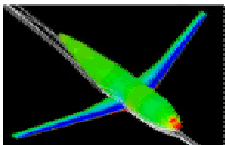

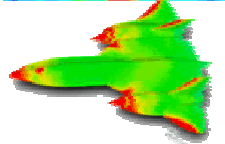

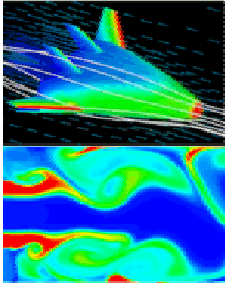

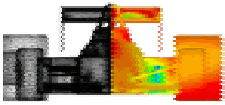

- Utilized ICEM CFD Hexa
- 3.5 Million hexahedras
- cell height off the wall: 0.007mm
- cell growth rate: 1.21-1.30
- B.L. cells:20
- 8 hours to produce from IGES

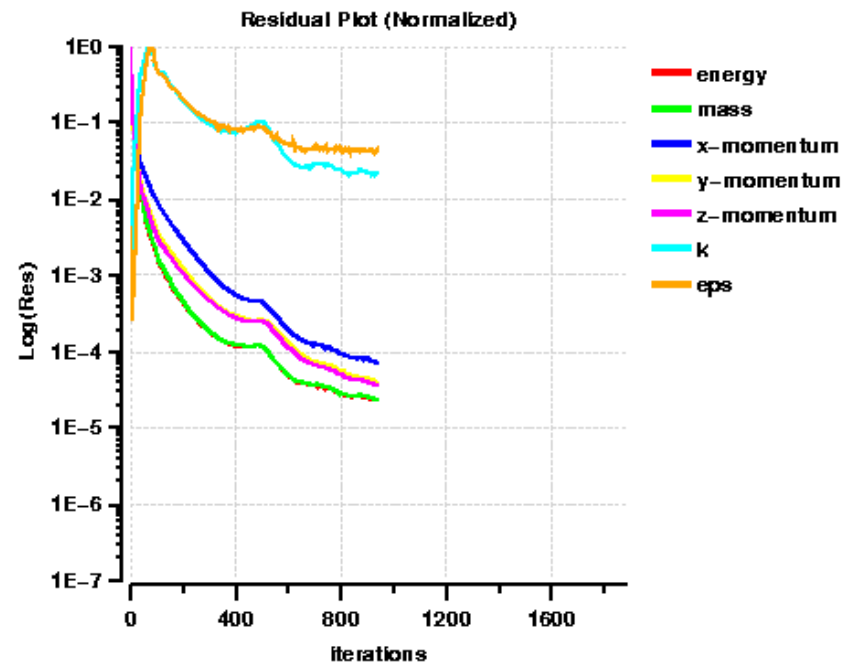

DLR-F4 WING/BODY Flow Conditions

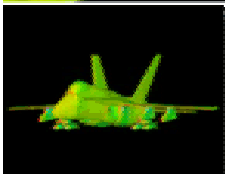

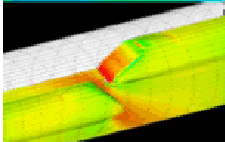

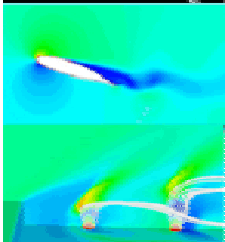

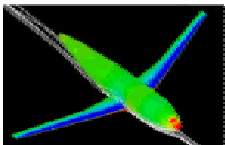

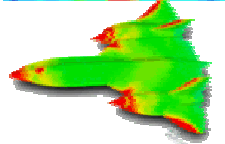

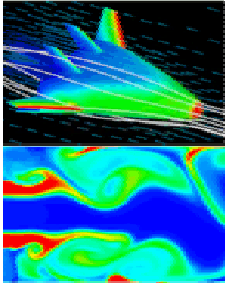

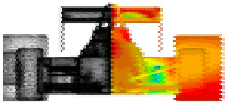

- $Re = 3 \times 10^6$ (based on $C_{ref} = 141.2$ mm)
- $M = 0.75$
- $T' = 0.2\%$
- turb. length scale not specified
- A.O.A -3 to 2 deg.
- Fully turbulent free air flow

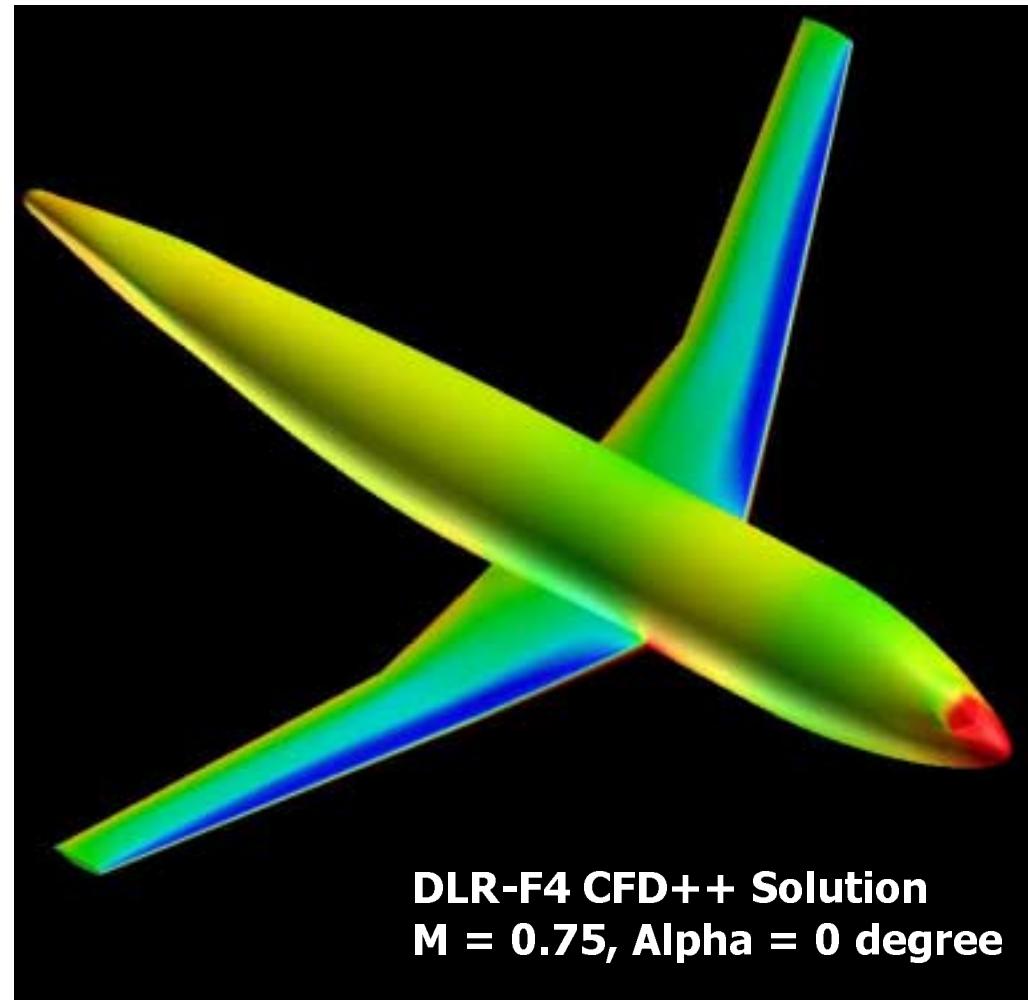

DLR - F4 WING/BODY Solution

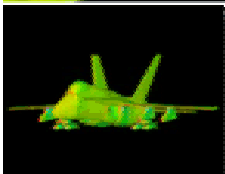

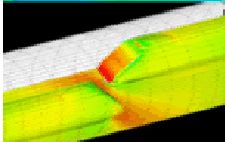

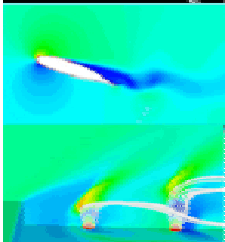

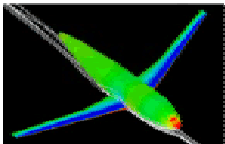

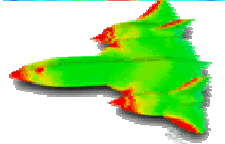

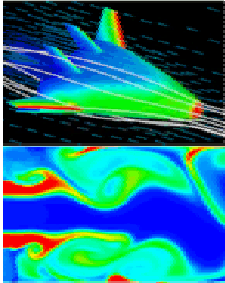

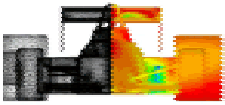

- Realizable k- ϵ model
- Case 1: solve-to-wall (STW), $y^+ < 2$ (3.5M Hex)
- Case 2: wall function, $y^+ = 25$ (3.2M Hex)
- Computer: SGI Origin 2000
- Processors: 16 R12000 300 MHz
- Run time: 20 hours wall clock
- Memory: 8.1GB

Solution input affecting the results:

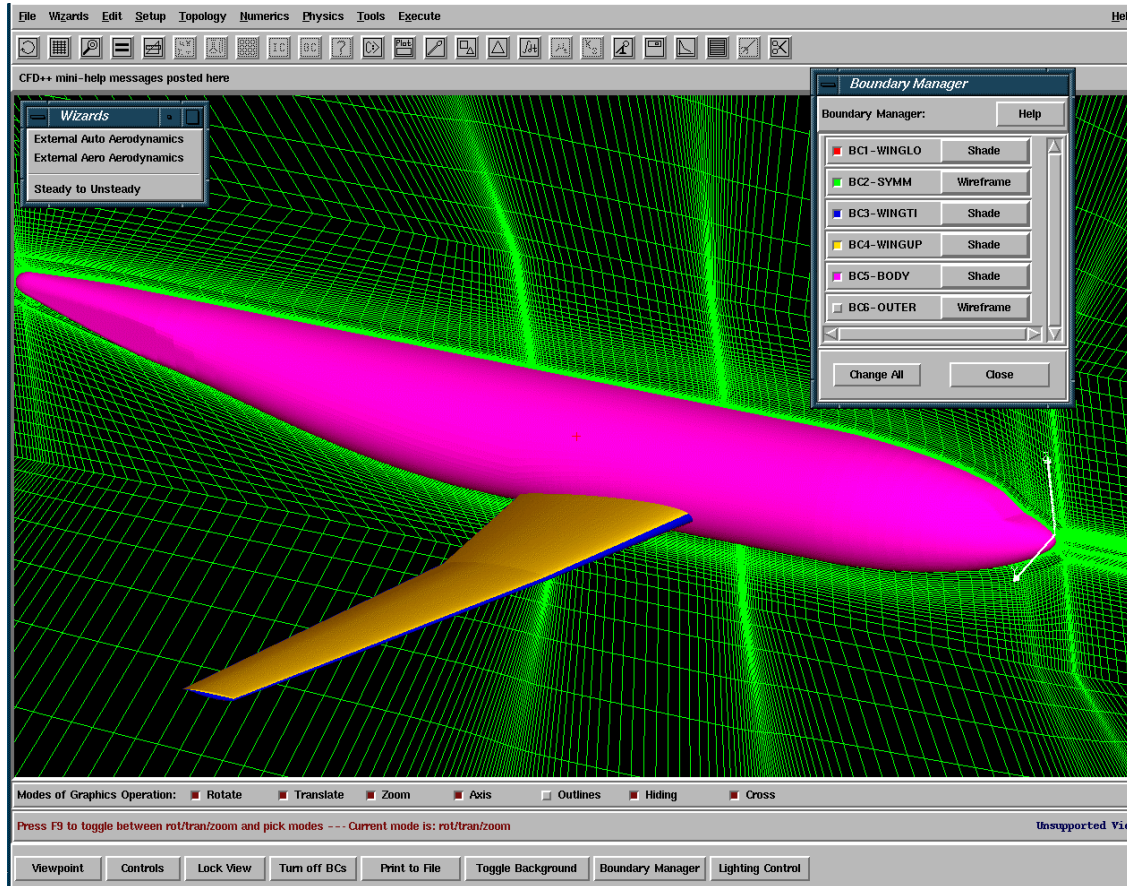

Inflow turbulence length-scale, l , **not specified**

Used $\varepsilon = \frac{C_{\mu}^{3/4} k^{3/2}}{\kappa l}$

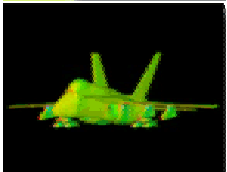

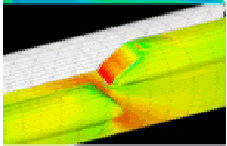

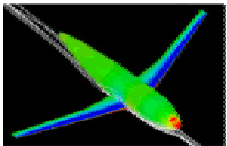

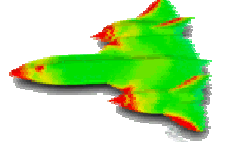

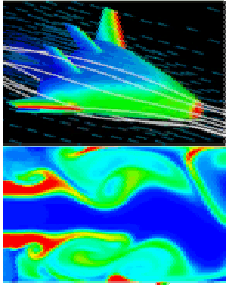

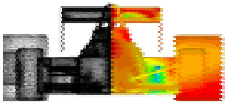

With $l = 1mm$

CFD++'s ease of use aspects

- User-friendly, self-guiding GUI
- Aero Wizard sets up case based on Re & M
- Only B.C.s need to be specified

Conclusions

- CFD++ unstructured grid solver used to predict cases 1 (STW) and 2 (Wall function)
- STW and Wall function predictions are in excellent agreement at $\alpha = -0.335^\circ$
- All results, except C_m vs. C_l , follow the data trend
- Inflow turbulence specifications were inadequate
